horizontal set-up

"Hainbuch has put its best minds to work on providing the most versatility possible in its stationary chuck," said a company spokesperson. "With the Manok plus, achieve changeover from inside to outside clamping in approximately three minutes without having to remove the chuck from the machine. By switching from a spring-loaded to a mechanical releasing action on the Manok plus, the integrated forced opening allows for quick changeover. Add the Mando Adapt segmented mandrel for inside clamping, or jaw adapter for outside clamping. The jaw adapter doubles the clamping range, and also allows for milling and drilling between jaws."

"Other features of the Manok plus include an easily-accessible end-stop mount to adjust work piece depth, or the user may simply remove the end-stop for full through-bore capacity," said the Hainbuch spokesperson. "A milled surface allows the Manok plus to be set up for horizontal applications."

"The Manok plus from Hainbuch offers the same qualities as the original Manok stationary chuck, plus options for integrating a mandrel adapter or jaw adapter," said the spokesperson.
